Strengthening SDI in the Caribbean

Summary of progress

June 26, 2014

Overall objective:

Promote the development of spatial data infrastructure in member countries of the Association of Caribbean States, to strengthen the generation, use and sharing of geospatial information

Specific objectives:

- Support the integration and participation of Caribbean countries in the UN-GGIM: Americas initiative.
- Reduce the gap in Geospatial Data Infrastructure in the region, strengthening the use of geospatial information.

Main Procedures

- Diagnose the status of the building and management of geospatial information.
- Strengthen the framework of the Caribbean and the integration of Regional Geodetic Network.
- Support the development of a System of Classification and Land Cover Mapping.
- Establish a geomatics solution for the query, analysis and publication of the information generated by the project

Elements considered in the diagnosis

Information/Data availability

Human Resources

Access network

Spatial data sets

Spatial data services

Policies

Metadata availability

Human capital

SDI culture - education

Agreements

Web connectivity

Technology

Geospatial software availability

Caribbean Region

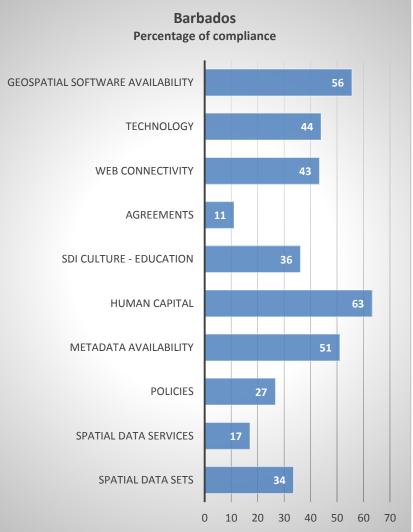

Barbados

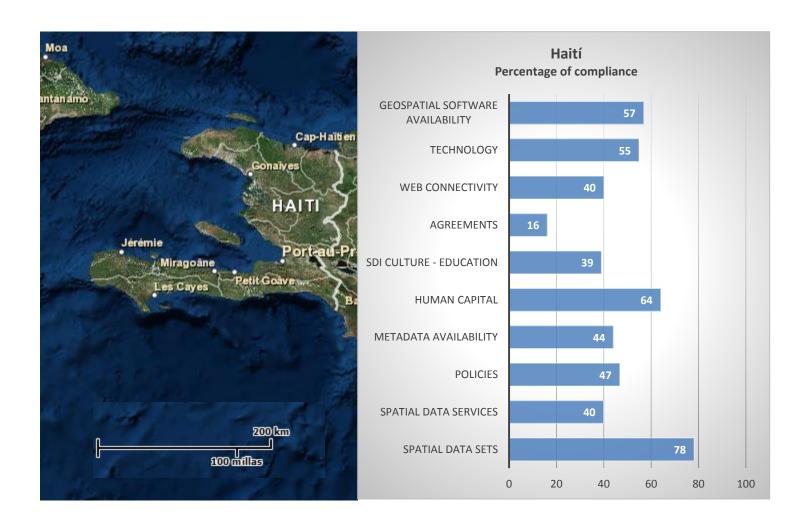

Haití

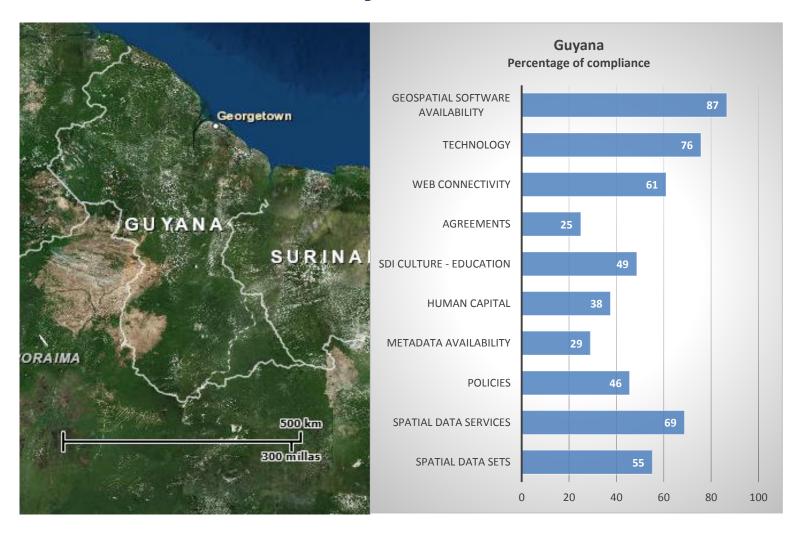

Guyana

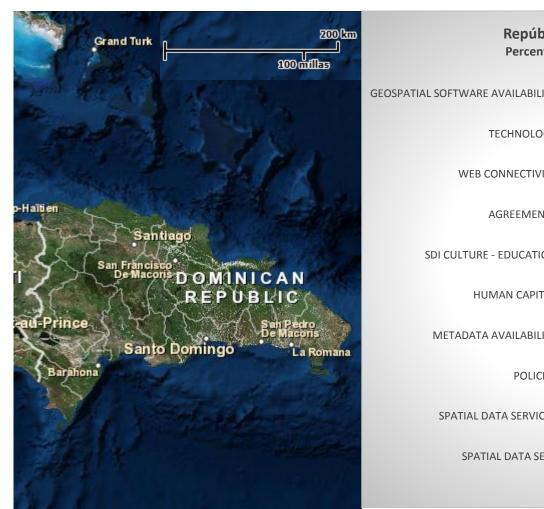

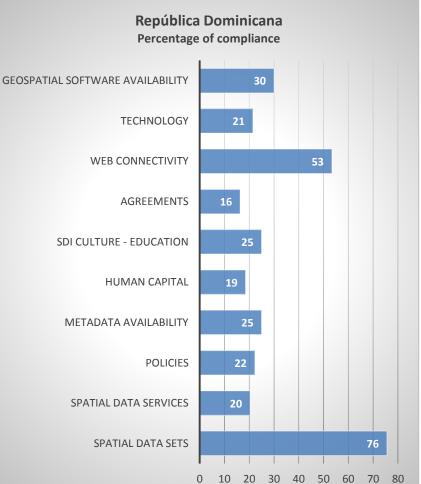

República Dominicana

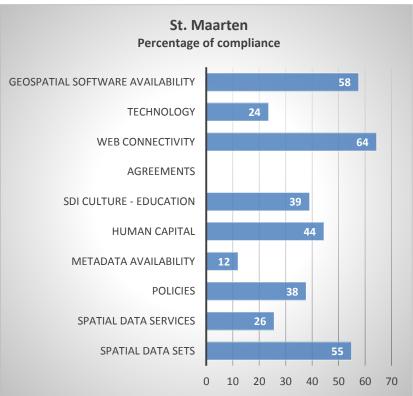

St. Maarten

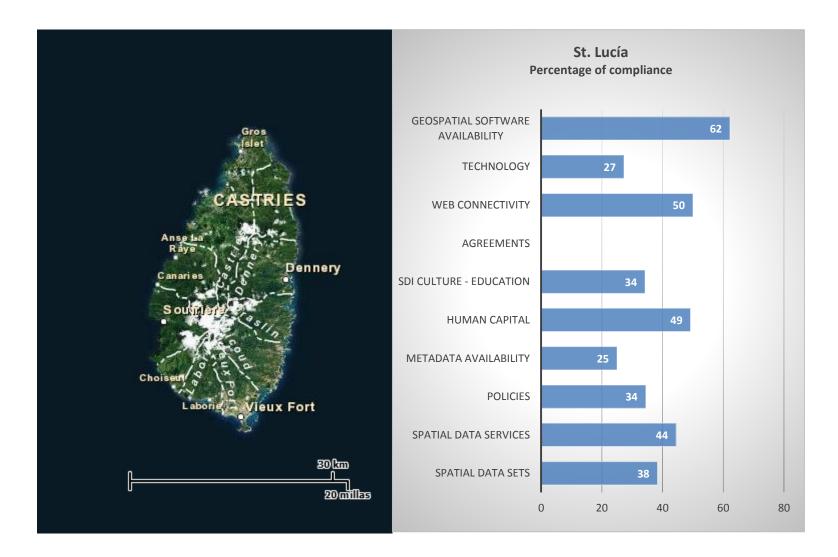

St. Lucia

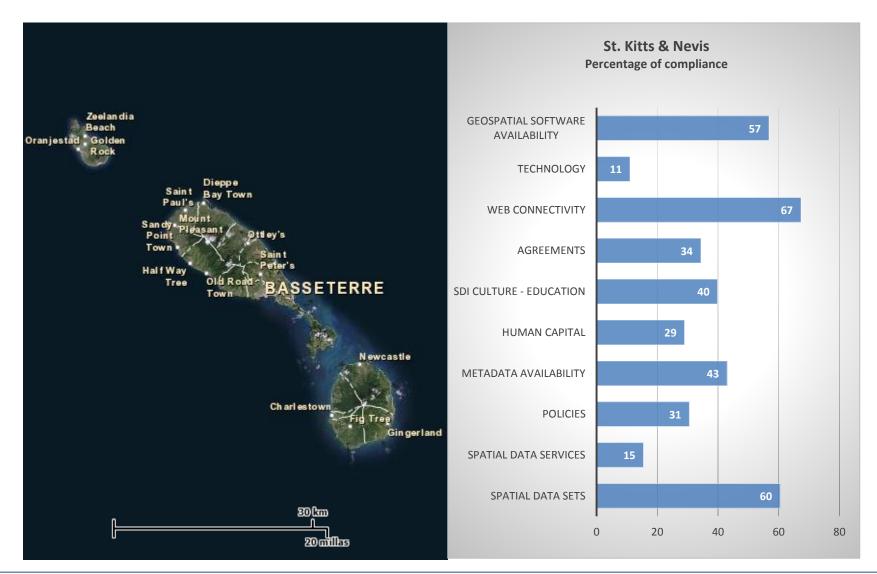

St. Kitts & Nevis

St. Vincent & The Grenadines

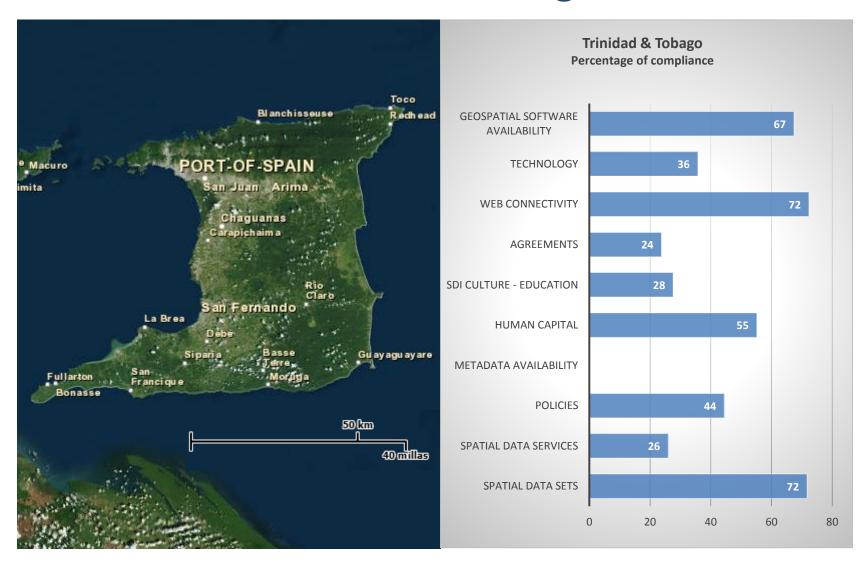

Trinidad & Tobago

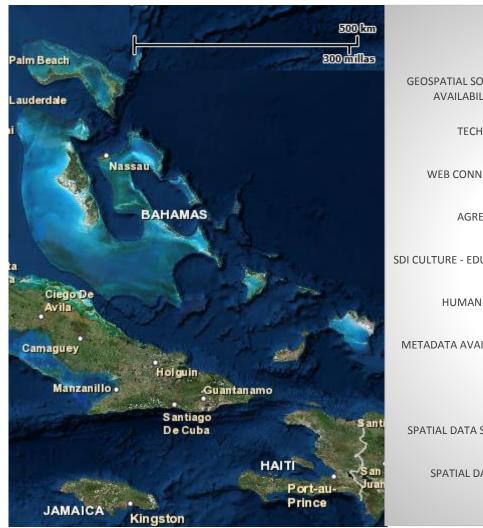

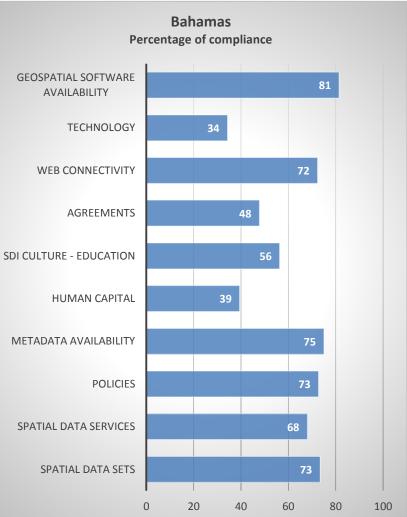

Bahamas

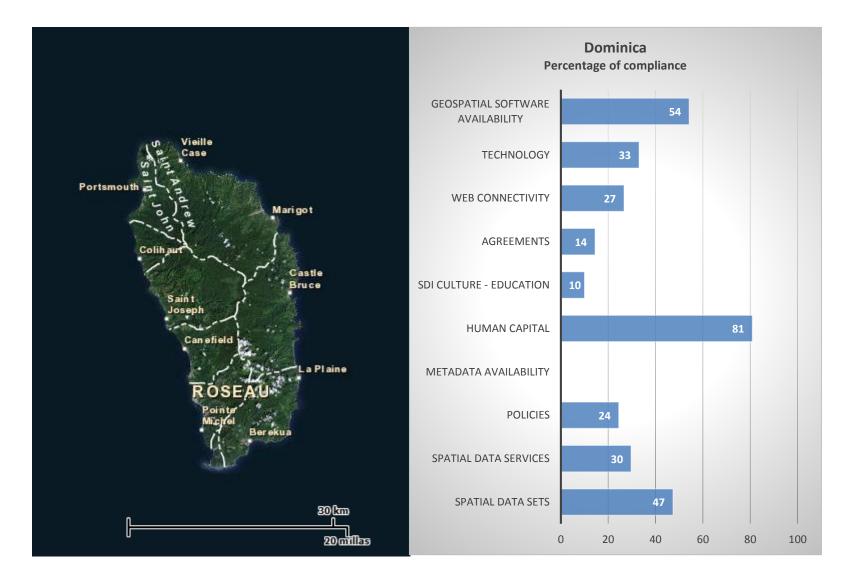

Dominica

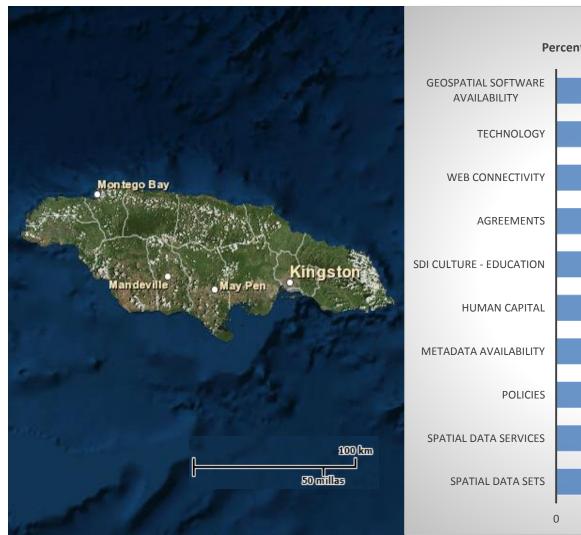

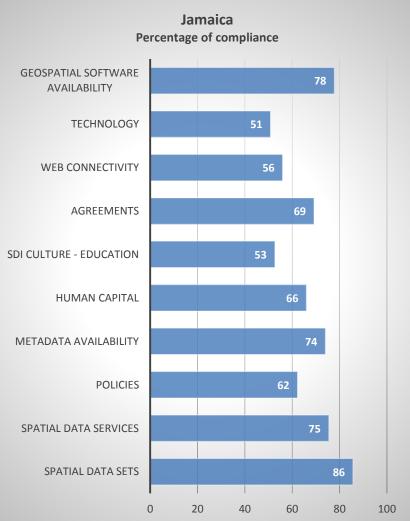

Jamaica

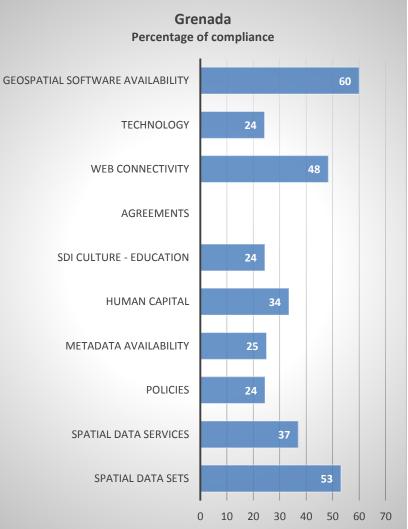

Grenada

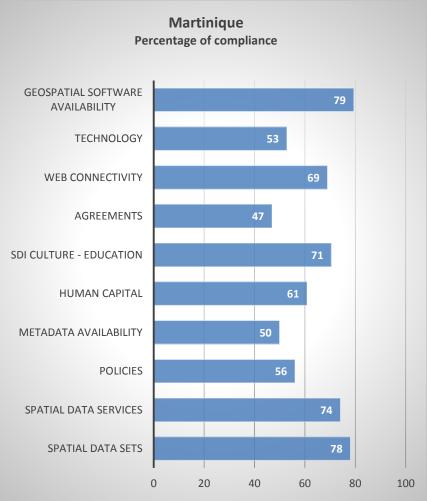

Martinique

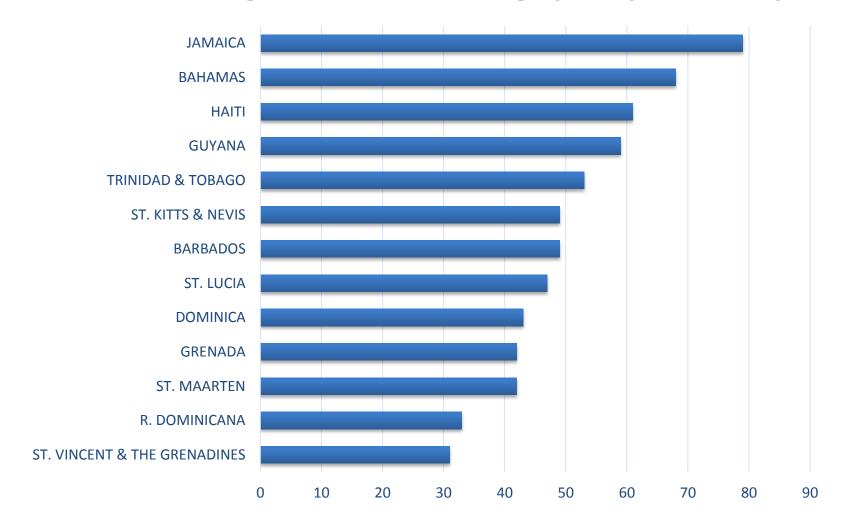

Average value of the gaps by country

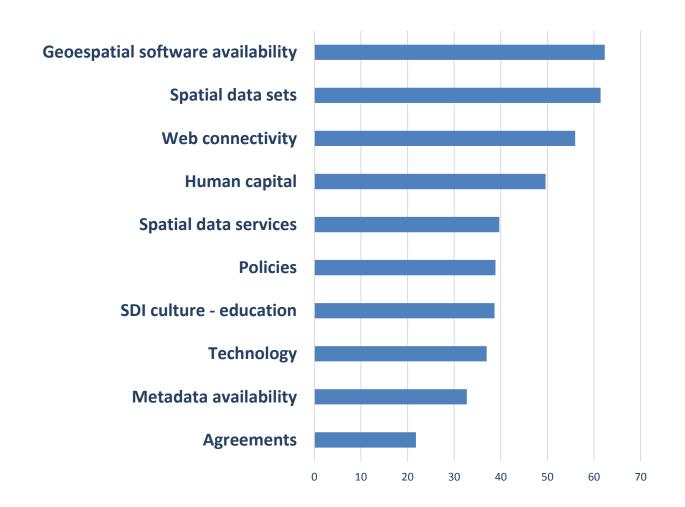

Average value per element for the region

Proposals

<u>Agreements</u> including policies and standards, represents the largest gap for the region, which can be reduced through a training program, mainly in the use of standards.

Using <u>metadata</u> is essential for proper housing management information is therefore necessary to implement a mechanism for its implementation.

As for the **technology**, aims to strengthen the region into two areas: improving the geodetic reference frame and renew some servers and computer equipment.

In connection with <u>spatial data services</u> offering a geomatics solution for internet dissemination of information is proposed.

Finally it is proposed to implement a comprehensive training program to build capacity and skills of **human capital**.

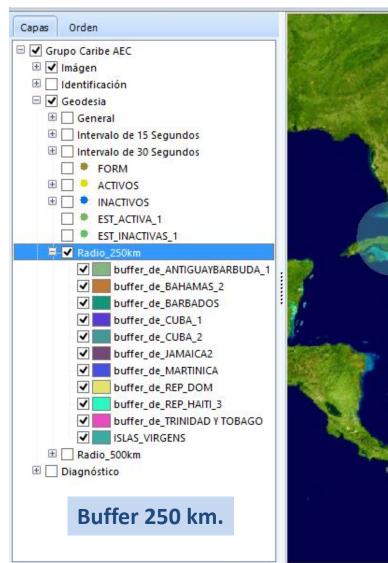

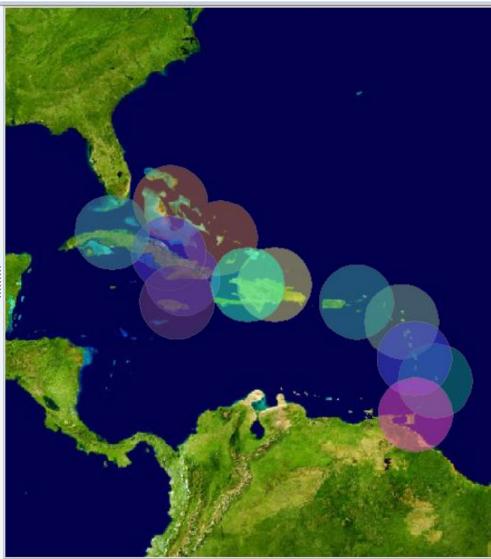

GNSS Network 13 Stations

Current actions

- We are building scenarios for the identification and positioning of the Geodetic Network in the region.
- We seek to establish contact with organizations working on similar projects in the region in order to join forces.
- Valoramos las características tecnológicas de los equipos GNSS, con el fin de seleccionar los de mejores características y de menor costo.

Map of vegetation cover

Current actions

- We are researching literature and cartographic material of the region, in order to have information for the regional criteria and refine training camps for the classification process.
- We test using satellite images of the region to assess their effectiveness and quality to produce a map of the vegetation of the region.
- We investigated similar work in the region in order to refine the selection criteria applicable to the project.

Geomatics solution

Current actions

- We analyze in detail the questionnaires in each country, to meet the technological and operation of computers and servers current Features.
- We are assessing the capabilities of the human capital issues of spatial data infrastructures in order to identify needs.
- We analyze the characteristics necessary equipment and means of communication that allow implementing a geoportal in each country.
- We investigate the solutions offered by other agencies to contact for information sharing and building synergies.
