

National Geodetic Network SIRGAS-CHILE Past, Present and Future

Ing. Héctor Parra B.
sirgas@igm.cl

MISSION

- The Military Geographic Institute of Chile (IGM) is the official organization that represents the Chilean State in all matters involving cartography, surveying and the management of the National Geodetic Network.
- To provide technical service information concerning the geography of Chile, as required by State agencies for the development and security of the nation.
- To be the national leader in the generation of geospatial information.

INTRODUCTION

- The Geodetic Department is composed of a calculation division and data processing center, plus field surveyors, under the Engineering Department of IGM.
- We are the agency responsible for field measurements, processing and maintenance of geodetic networks materializing horizontal and vertical reference systems, which serve for geo-referencing activities and projects developed in the country that can be represented in a cartographic sense for viewing in a local, regional or national context.
- Also, Chile is one of the most seismically active countries in the world and its geodetic networks are constantly changing, which requires us to maintain and update the horizontal and vertical geodetic framework.
- State agencies and private users need to represent the activities carried out in Chile as accurately as possible and it is the task of IGM to maintain modern geospatial infrastructure according to the needs of today.

CLASSIC REFERENCE SYSTEMS IN SOUTH AMERICA

TRIANGULATION NETWORK 1940-2000

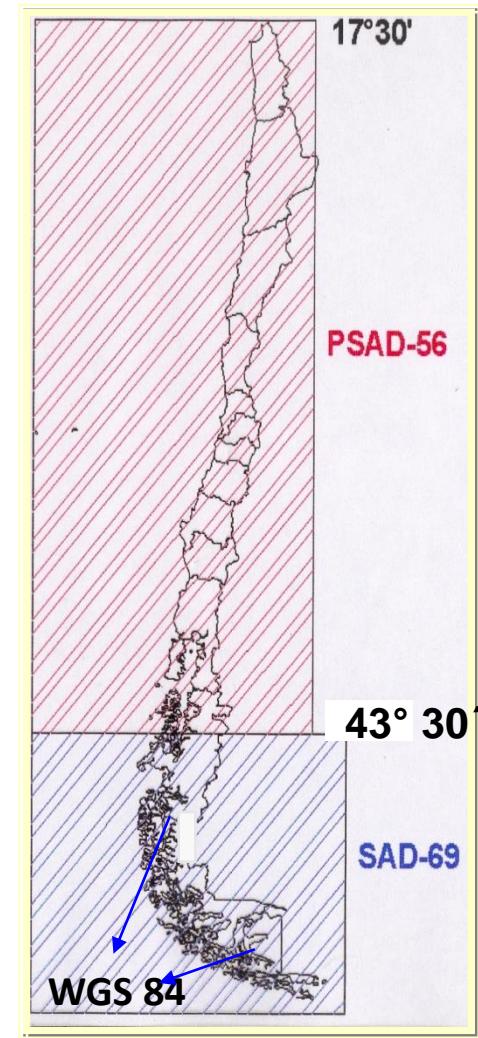

DATUM USED IN CHILE UNTIL 2000

PSAD 56

- $17^{\circ} 30'$ to $43^{\circ} 30'$
- La Canoa, Venezuela
- International ellipsoid of 1924
- Used for 1:50.000 scale cartography

SAD 69

- $43^{\circ} 30'$ to the south
- Chúa, Brazil
- South American ellipsoid of 1969
- IPGH recommendation
- Used for 1:50.000 and 1:25.000 scale cartography

GEOCENTRIC REFERENCE SYSTEM FOR SOUTH AMERICA (SIRGAS PROJECT)

Paraguay, 1993, IPGH meeting.

OBJECTIVES

- Define a Reference System for South America.
- Establish and maintain a framework.
- Define and establish a geocentric datum.

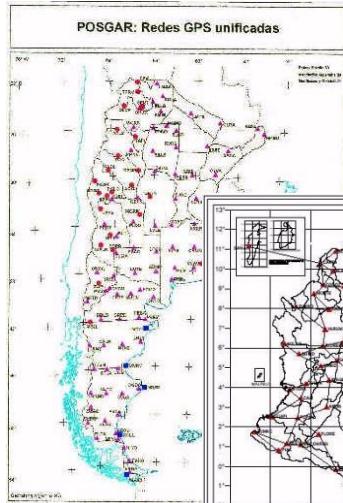

GOALS

- Promote and coordinate the work of each South American country to achieve the defined objectives.
- Initially focus attention to a horizontal datum.
- To facilitate the connection of pre-existing networks.

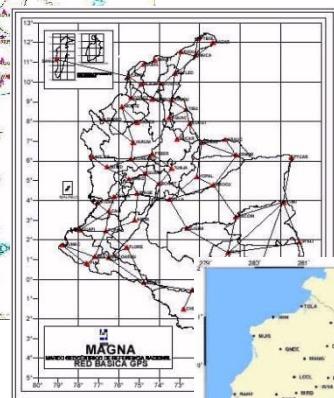

COMMITMENTS

- Establish a SIRGAS reference system based on the International Terrestrial Reference Frame (ITRF).
- Geocentric Datum: coordinate axes based on the SIRGAS Reference System and ellipsoid parameters "Geodetic Reference System (GRS) of 1980".

UNAVCO Resources: GNSS Station Monumentation

Article ID:104 | Rating: 5/5 from 1 votes | Last Updated: Wed, Feb. 24, 2010 at 7:40 PM

UNAVCO Resources: GNSS Station Monumentation

[Current as of December 2008]

UNAVCO can provide assistance with design, purchasing, and construction of geodetic monumentation to NSF- and NASA-funded science groups for permanent, long-term, and campaign GNSS site installations. Click on the links below for more information on each.

Things to consider in choosing a monument type include stability (precision) needed, funds available, time available, site accessibility, site security, and additional information on monumentation in general consider reading: [Physical Site Specifications: Geodetic Site Monumentation](#).

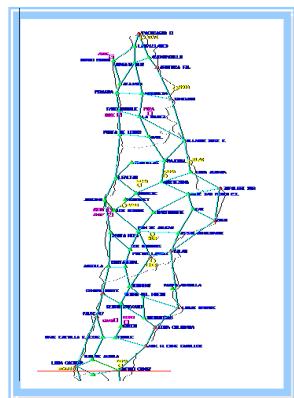

Permanent and Long-term Monument Comparison Table

	Type	Stability*	Cost**
	Deep drilled braided (permanent)	high	\$7500-15k
	Shallow drilled braided (permanent)	high	\$500+
	Shallow braided (non-drilled) (permanent)	med-high	\$300
	Concrete pillar (permanent)	med	\$500-2k
	Thermopile (permanent)	med-high	\$6700-1k
	Polar mast	green	orange

	Polar mast (permanent, long-term, campaign)	med-high	\$500	1 hr	1	BR	yellow
	Shallow foundation mast (permanent)	med-high	\$150	1-2 d	1	BR	yellow
	Stainless steel pin w/ mast (permanent, long-term, campaign)	med-high	\$150	1 hr	1	BR, R	yellow
	5/8" all-thread (permanent, long-term, campaign)	med-high	\$30	1 hr	1	BR, R	yellow
	Tech 2000 (campaign)	low	\$500	<1-2 hr	1	BR	yellow
	Monument Marker (campaign)	med-high	\$15-50	<1 hr	1	BR, R	yellow
	Custom	-	-	-	-	-	-

Installed Weight: Estimate weight of mast
Labor: Estimate cost of labor required
Latitude: BR = Below sea level, R = north (parallel)
Cost: low = < \$200, med = \$1000, high = \$5000 – Note that these are very rough approximations. The actual cost of a monument installation may vary depending upon site conditions and materials required.
Time: low = < 1 hr, med = 1-2 hrs, high = > 2 hrs
High: high = best/most, construction durability potentially using several years
Med: medium = average, construction durability several months
Low: low = any, temporary, construction durability very little
Note: Many other monuments are available, please contact UNAVCO for more information.

EAF-GPS

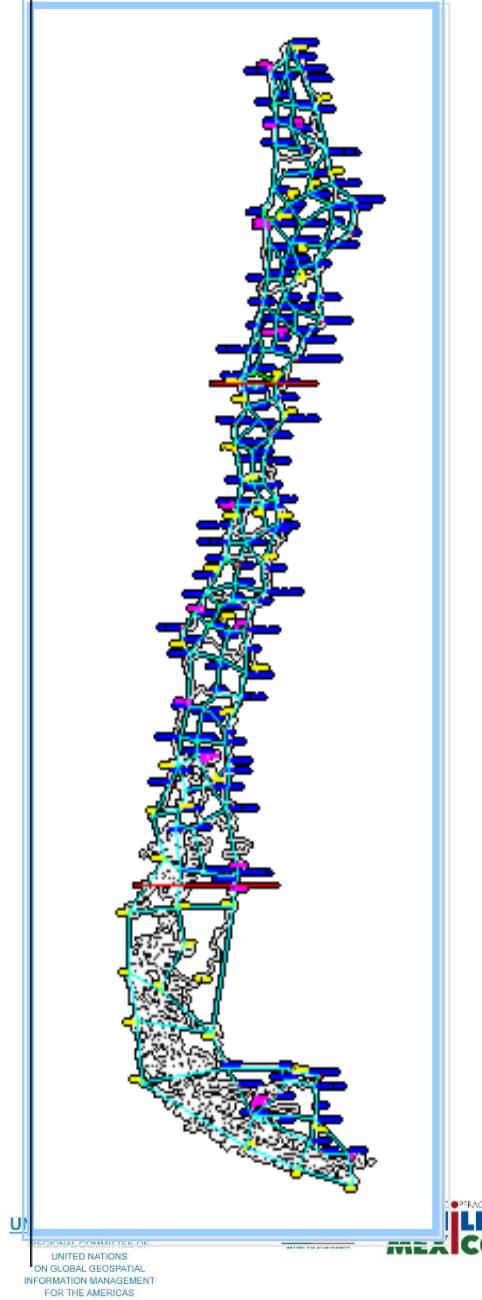

CGPS NETWORK

GPS stations that operate continuously and that calculate daily coordinates of a point.

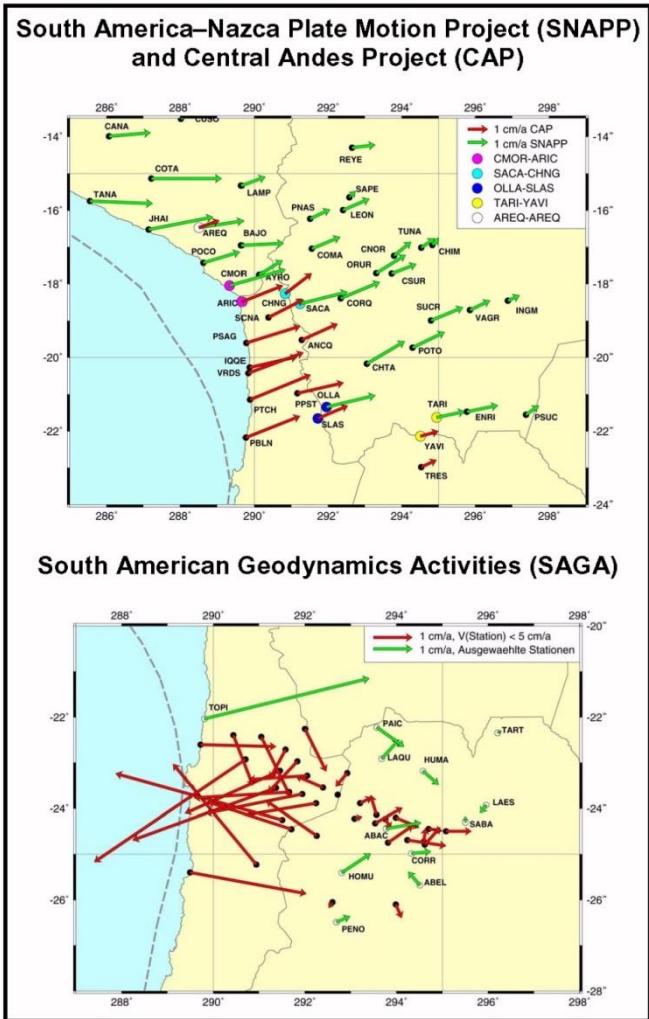

1. Monitoring deformation of the earth's surface.
2. Velocity model calculation.
3. Network support for Differential GPS users.

Basic Network

Selecting points throughout the country that are remeasured every two years in order to compute the variation of the coordinates and determine velocities and displacements.

Densification Network

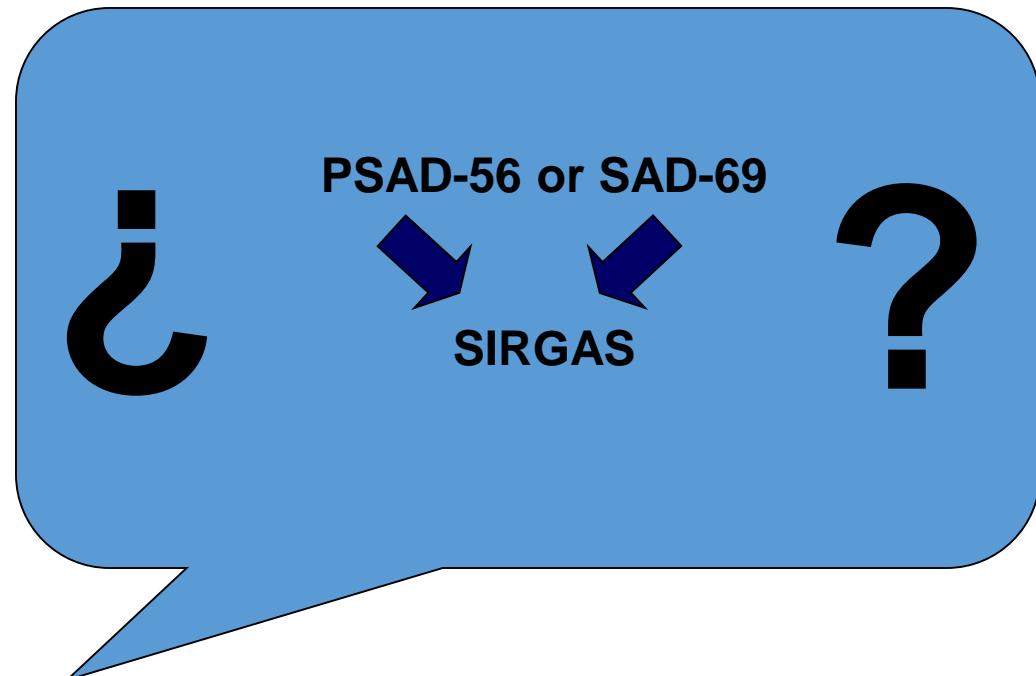

- Homogeneous distribution.
- Support for traditional methods.
- Range +/- 50 km.
- Located where users need it.

TRANSFORMATION PARAMETERS PROJECT

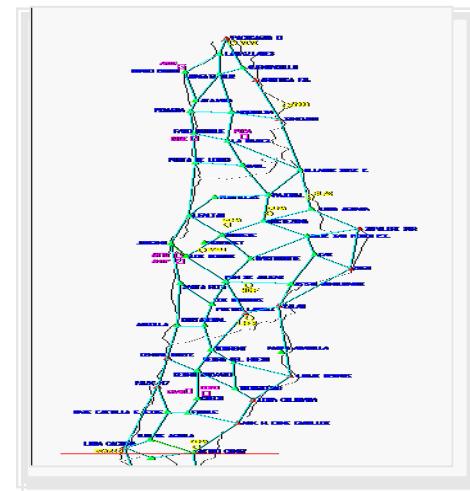

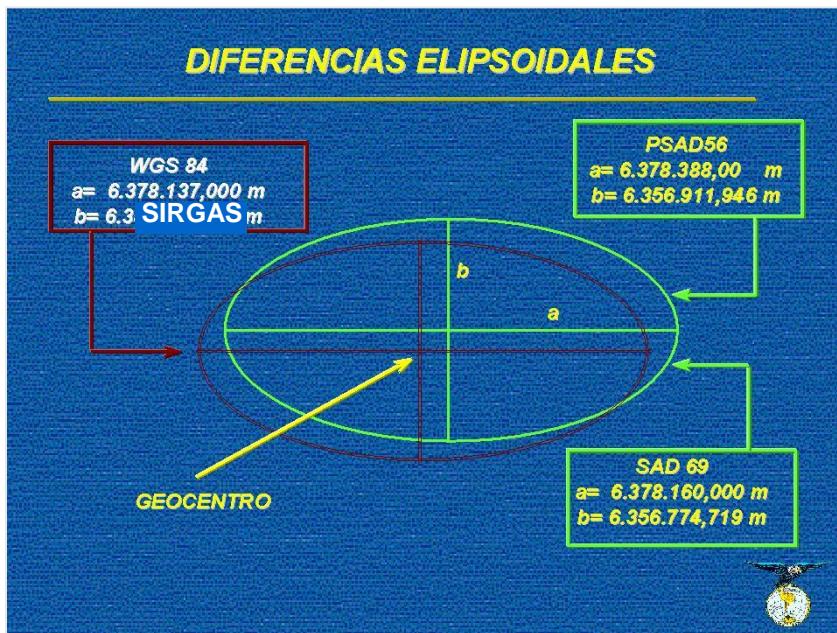

Association of Caribbean States
Asociación de Estados del Caribe
Association des Etats de la Caraïbe

TRANSITION PERIOD

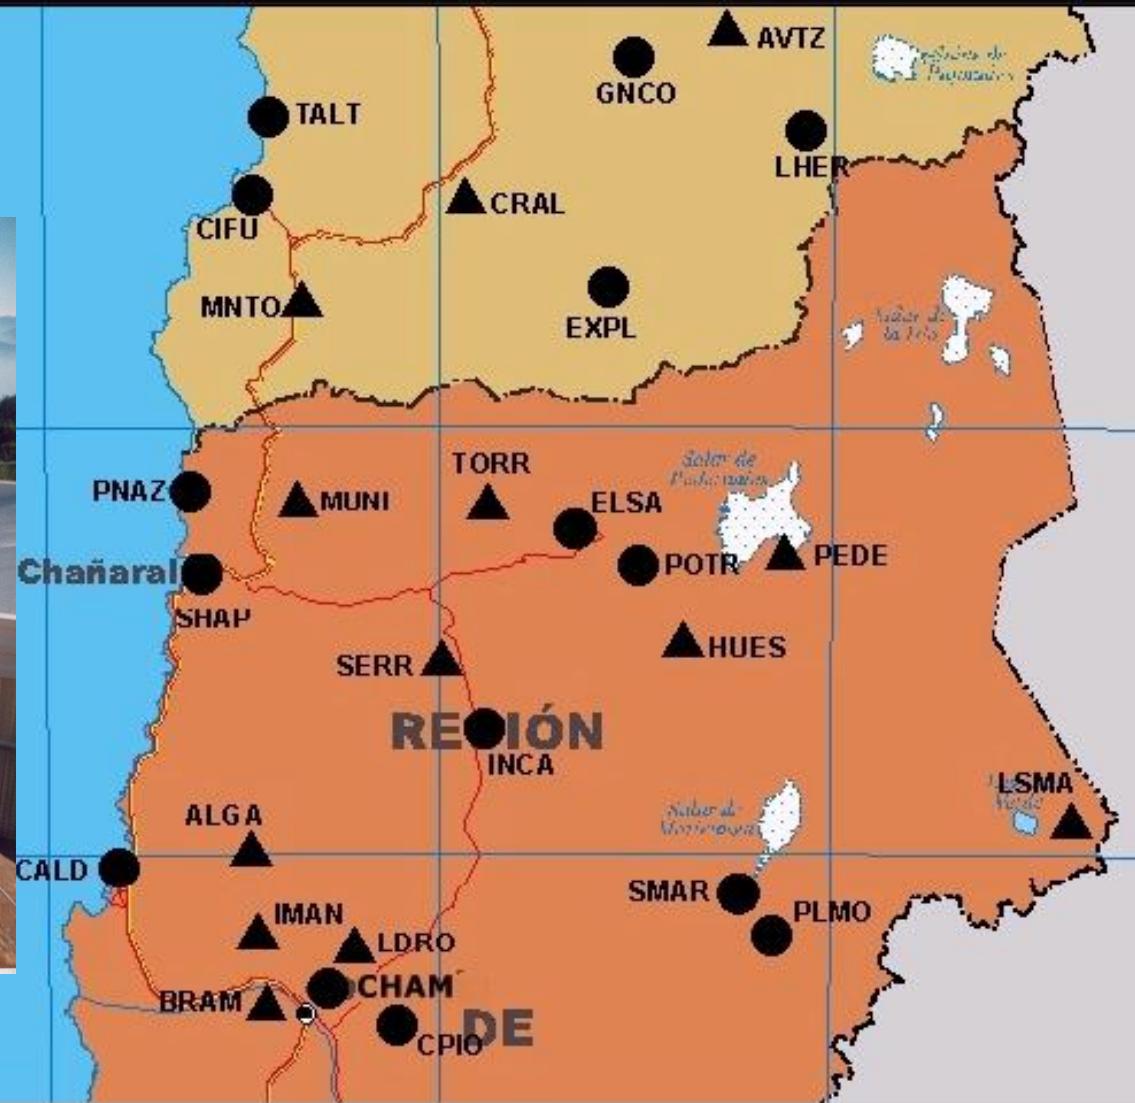

- In a transition phase the parameters for cartographic transformation between the earlier, existing systems and SIRGAS are being made available to the public in Chile so that users can migrate their systems with the least possible error. To facilitate this, the relevant tools are available to users online (www.igm.cl)

IGM invites users to densify the network

The network is made more dense annually by the IGM and by “Joint Campaigns” in which we invite Chilean users to participate in the measurement of terrain in places chosen by them, following IGM measurement protocols. The IGM processes the data and sends certificates of the coordinates to the participants, without cost to them, thus ensuring that projects in Chile are geo-referenced in SIRGAS.

- Objective: Densify the National Geodetic Network in places of interest to different users.

- Participants: Any institution holding dual-frequency GPS receivers.

- Data processing: IGM, Bernese software

Participation of 35 organizations.

LEGAL ASPECTS

The screenshot shows the homepage of the Snit (Sistema Nacional de Coordinación de Información Territorial) website. The header features the Snit logo, a map of Chile, and the text "Sistema Nacional de Coordinación de Información Territorial" and "Infraestructura de Datos Geoespaciales de Chile". It includes a search bar and links for "Inicio", "Contáctenos", "Mapa", and "RSS". The main content area has a blue background with white text. On the left, there's a sidebar with links to "Geoportal Chile", "Catálogo Nacional" (with a note about the National Information Portal), "Suscríbete al Newsletter" (with an input field for email), "Comunidad Geoespacial", and "Galería de FOTOS". The central column has several news items: one about the Ninth United Nations Regional Cartographic Conference (with a UN logo); another about the new website for Aysén Region; and a third about the new SNIT website section for companies related to geospatial information and public tenders. On the right, there's a graphic titled "Servicios de Mapas en Regiones" showing a map of Chile.

Durante la semana del 10 al 14 de agosto se realizó la Novena Conferencia Cartográfica Regional de las Naciones Unidas

Bajo el título de "Construyendo Infraestructuras Geoespaciales en apoyo a la Prevención y Administración de Desastres", más de veinte países e Instituciones Internacionales, se reunieron en la sede central de las Naciones Unidas en Nueva York. El Secretario Ejecutivo del SNIT fue elegido vicepresidente de la Conferencia.

Sítio Web SNIT incorpora listado para empresas relacionadas con la información geoespacial y licitaciones públicas

Se encuentra disponible nuevo sitio de información territorial para la Región de Aysén

Se trata del sitio de la Región de Aysén desarrollado en conjunto por la Secretaría

VII Conferencia Cartográfica Regional para las Americas, de las Naciones Unidas
Nueva York, 22 – 26 de Enero, 2001

La Conferencia,

Reconociendo la importancia de los datos de posicionamiento tri-dimensionales de alta calidad, referenciados a un sistema de referencia geodetico mundial unico, para la infraestructura de datos espaciales ;

Observando el hecho que subsisten grandes diferencias entre los datums geodeticas nacionales existentes;

En consideración de los logros obtenidos por el proyecto del Sistema de Referencia Geocéntrico para las Americas (SIRGAS) con respecto a un datum geodetico unificado.

Tomando en cuenta el hecho que el marco de referencia de SIRGAS esta basado en el “International Terrestrial Reference Frame” (ITRF), y observando que el Sistema Geodetico Mundial de 1984 (WGS 84) es prácticamente identico al ITRF,

Tomando en cuenta tambien el hecho que SIRGAS presta apoyo a los paises que participan, en terminos de la transferencia de conocimientos y la capacitación,

Recomienda que los paises miembros de las Americas integran sus sistemas geodésicos nacionales en un sistema de referencia compatible con el SIRGAS;

Recomienda tambien que los paises miembros de las Americas proporcionan al SIRGAS los datos de gravedad destinado al calculo del geoide como la superficie de referencia para el sistema vertical (alturas);

Recomienda adicionalmente que los paises miembros de las Americas corrigen sus nivelaciones mediante observaciones gravimetricas para poder calcular los numeros geopotenciales y conectar los redes de nivelación con sus respectivos paises vecinos, permitiendo que toda esta información esté a la disposición del SIRGAS

Sistema Nacional de Información Territorial

SNIT

2.- Instructivo Presidencial N°002 del 07.ABR.2003.

Párrafo 4.a.- En mérito de lo anterior y considerando la proyección estratégica que para el desarrollo de la gestión gubernamental implica contar con un Sistema Nacional de Información Territorial. He resuelto impartir las siguientes instrucciones :

Los órganos de la administración del Estado deberán continuar colaborando en la etapa de implementación del Plan Nacional de Captura y Estandarización, que está siendo distribuido por el Presidente del Comité de Ministros de la Ciudad y el Territorio.

Sistema Nacional de Información Territorial

SNIT

1.- El Plan Nacional de Captura y Estandarización de la Información Territorial (DIC.2002), definió ocho objetivos específicos.

Obj. N°2.- Construcción de los datos fundamentales (Core Data).

En el contexto del SNIT se buscó la definición de una base compuesta por aquellos temas geográficos mínimos que son requeridos por la gran mayoría de los organismos, y que tienen una utilidad generalizada y común. Estos temas constituyen lo que genéricamente se denomina “Datos Fundamentales”, “Dato Foco” o “Core Data”.

La finalidad última es que este conjunto de Datos Fundamentales se constituya en una base única estándar, para que sobre ella sean representadas todas las temáticas territoriales específicas que desarrollan los diversos organismos del Estado, de acuerdo a sus respectivos ámbitos de acción.

Estos Datos Fundamentales son :

- Georreferenciación : uso oficial del Sistema de Referencia Geodésico WGS-84 (SIRGAS).
- Toponomía.
- División Político - Administrativa.
- Infraestructura de Transporte.
- Relieve.
- Hidrografía.
- División Predial

GOBIERNO DE CHILE
MINISTERIO DE BIENES NACIONALES
GABINETE DE LA MINISTRA

ORD. GABM. N° 771

ANT.: No hay.

MAT.: Solicitud adoptar sistema de referencia geodésico único (SIRGAS).

SANTIAGO, 25 AGO 2009

DE : SRA. ROMY SCHMIDT CRNOSIJA
MINISTRA DE BIENES NACIONALES
A : SEGÚN DISTRIBUCIÓN

Como es de su conocimiento, el Sistema Nacional de Coordinación de Información Territorial (SNIT), creado por Decreto Supremo N°28/2006 del Ministerio de Bienes Nacionales, tiene por objetivo coordinar a las instituciones públicas del país para lograr una gestión eficiente de la información geoespacial que generan, en el entendido que ésta, constituye una herramienta fundamental para la toma de decisiones y además, un bien público al servicio de toda la ciudadanía.

Un objetivo central de este sistema de coordinación, es lograr la interoperabilidad de la información geoespacial. Esta condición permite integrar en forma efectiva productos o datos generados por diversos órganos del Estado, agregándoles valor y posibilitando la visión de un conjunto de variables en el territorio de gran utilidad para la gestión institucional, como por ejemplo en la focalización de recursos, localización de actividades productivas y de servicios, asignación de beneficios sociales, entre otros.

Dentro del conjunto de atributos técnicos que confluyen en el logro de la interoperabilidad de la información geoespacial, un elemento central corresponde a la utilización de un sistema de referencia geodésico único para el país. Esto permite básicamente que la superposición de cartografía generada por distintos organismos esté libre de problemas de cauce y que la localización de un elemento del territorio sea siempre la misma en todos los mapas.

El Instituto Geográfico Militar (IGM) es el organismo oficial encargado de la representación cartográfica del país (D.F.L. N°2090/1930). Además, es la Institución que ha sido designada en el Ministerio de Defensa, para coordinar el área temática de Información Territorial Básica en el ámbito del trabajo del SNIT. Este organismo ha liderado el proceso de definición técnica de un sistema de referencia único para el país, denominado SIRGAS, el cual ha sido difundido hasta la fecha con el carácter de recomendación.

Por la relevancia que tiene para el país, utilizar un sistema de referencia geodésico único, y conforme a lo establecido en el D.S. N° 28 de 2006, del Ministerio de Bienes Nacionales, y los objetivos del Plan de Trabajo del SNIT aprobado por el Consejo de Ministros de la Información Territorial, solicito a Ud., si lo tiene a bien, instruir el uso de

GOBIERNO DE CHILE
MINISTERIO DE BIENES NACIONALES
GABINETE DE LA MINISTRA

este sistema en todas aquellas dependencias ministeriales cuyas funciones estén vinculadas con la elaboración de cartografía o generación de datos georeferenciados, cualquiera sea su naturaleza y contenido.

Adjunto encontrará un documento técnico elaborado por el IGM sobre el referido sistema, sin perjuicio de lo cual el Secretario Ejecutivo del SNIT, Sr. Cristián Aqueveque, podrá dar los antecedentes necesarios a quien usted designe.

Saluda atentamente a usted,

Adjunto:

THE CHILEAN NATIONAL GEODETIC NETWORK TODAY

National Geodetic Network SIRGAS - CHILE

Horizontal Control

Passive Network

It consists of a network of 130 points distributed from Arica to Antarctica, with coordinates in the reference system officially called SIRGAS - Chile.

These points serve as a support network for differential measurements for users of Global Navigation Satellite Systems (GNSS) in Chile.

The IGM provides site descriptions and approximate coordinates (monographs) of each of these points so the users can get official certificates of coordinates to support the work done by users of the National Reference Frame. (www.igm.cl)

National Reference System: SIRGAS - CHILE

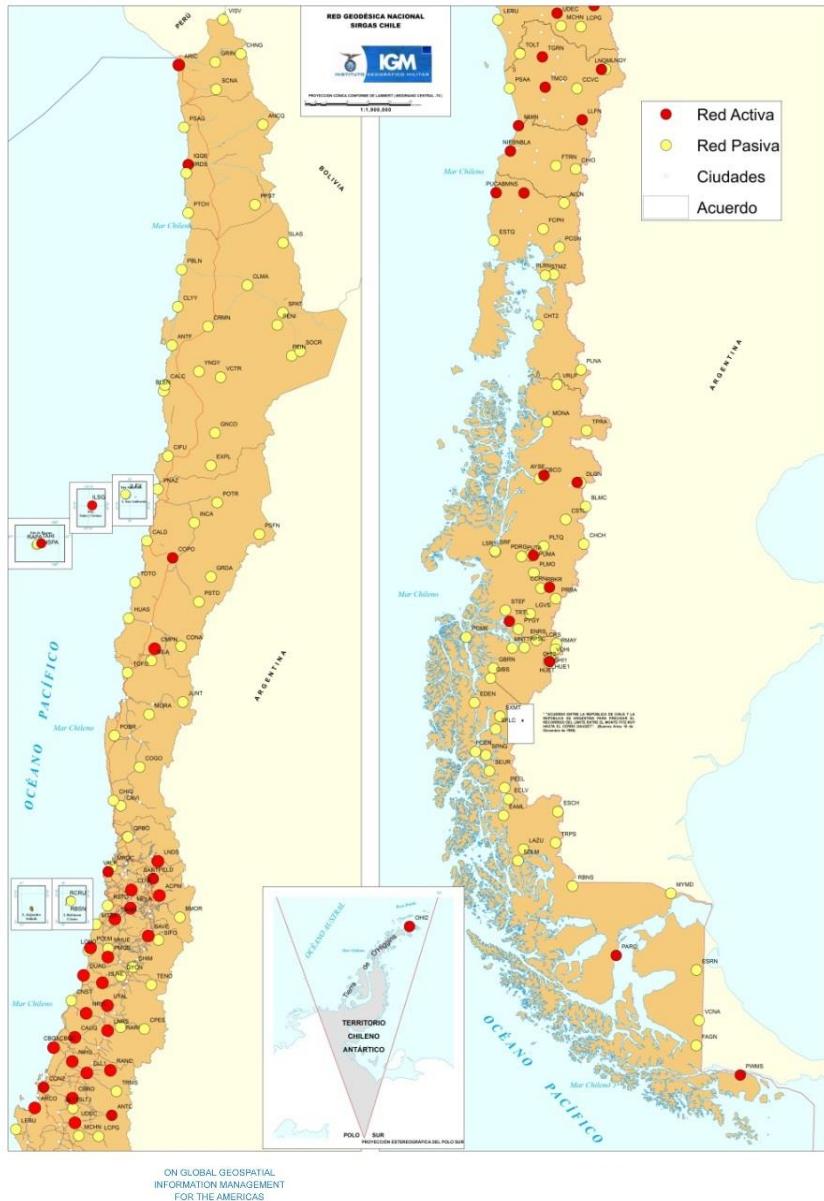

Epoch before the 2010 earthquake : 2002.0

Temporary epoch post earthquake : 2013.0

New scheduled epoch : 2016.0

National Geodetic Network SIRGAS - CHILE

Horizontal Control

Active GNSS Network Stations

The IGM manages and maintains a network of 60 continuous GNSS stations spread throughout the country resulting in a modern reference system, which is used mainly as:

- Geodetic infrastructure for the development of the official maps of Chile.
 - Densification, data processing and adjustment of the SIRGAS-Chile National Geodetic Network.
 - Studying and monitoring deformations of tectonic plate models and velocity calculation, mainly affected by natural phenomena such as earthquakes, tsunamis and volcanic activity occurring in the country.

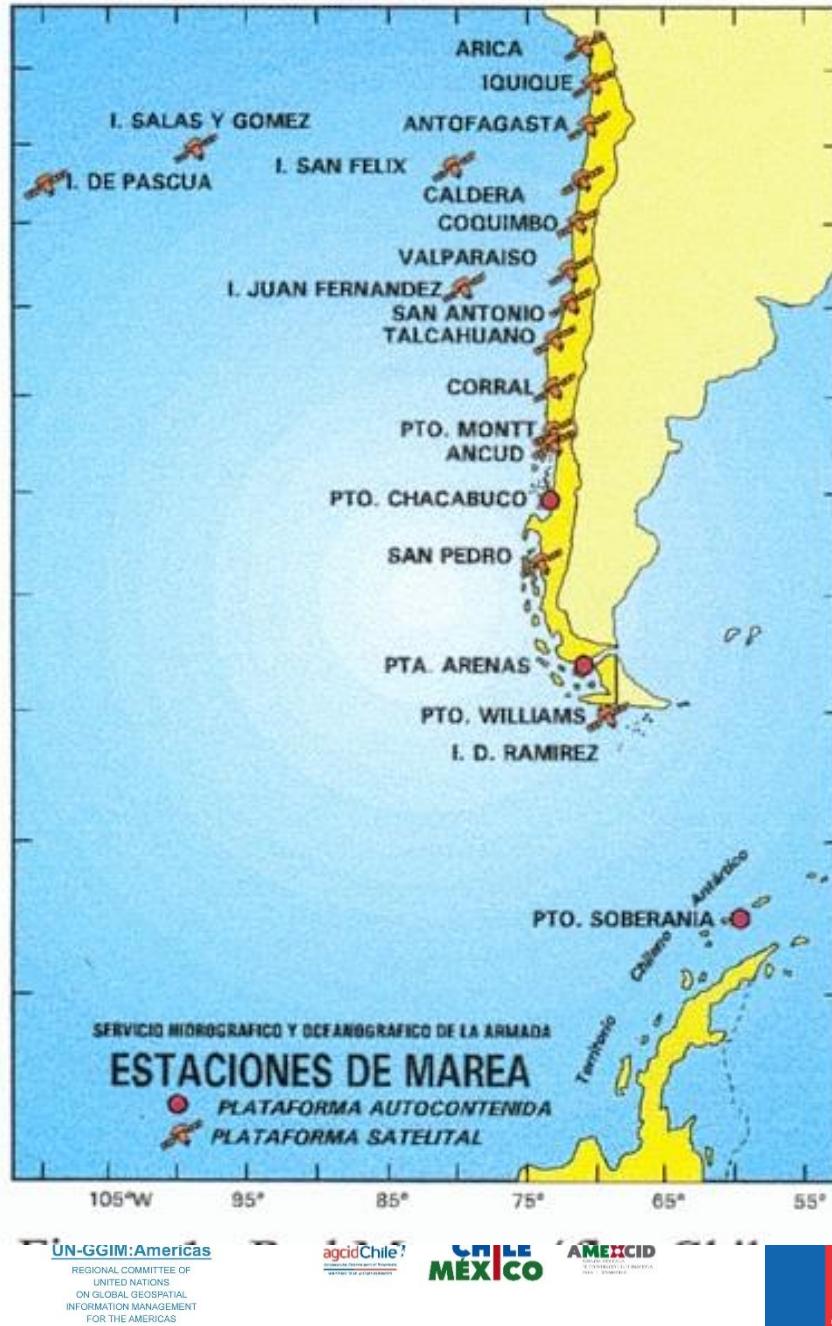

National Geodetic Network SIRGAS - CHILE

Vertical Control

LEVELING NETWORK

- The leveling network is composed of 5,000 points located mainly along the country's roads. The vertical datum corresponds to the height mean sea level.
- The mean sea level (msl) is determined by a tide gauge network distributed along the coast of Chile, which is managed by SHOA, the responsible agency for determining the mean sea level in Chile.
- Unfortunately and due to such factors as: vandalism, natural phenomena, new construction of highways and roads, etc., we are forced to remeasure and recover this vertical reference system in permanent way.

Vertical Control

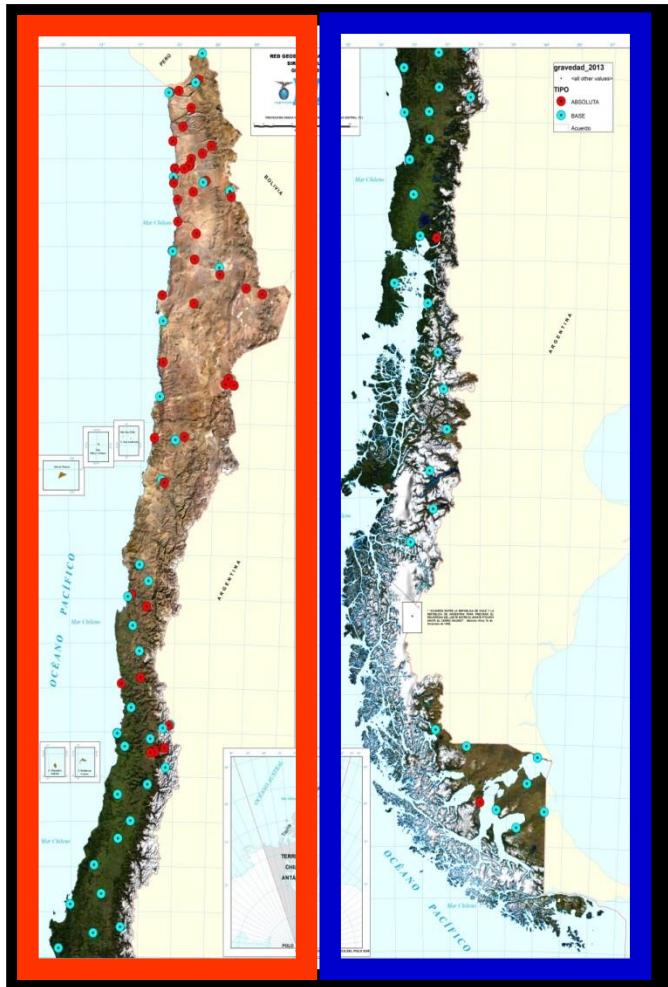

Gravity Network

- The gravity network in Chile has been developed by working together with various international organizations such as the National Geospatial-Intelligence Agency (NGA), University of Sao Paulo, the Brazilian Institute of Geography and Statistics, IRD of France and the DTU Denmark.
- The gravity network consists of 60 absolute gravimetric points and 70 relative gravimetric points. This information supports the work of making gravimetric maps of Chile, local geoid models and control of global geoid models.

It should also be noted that Chile is an active member within the Reference System for the Americas (SIRGAS). It meets the objectives and proposals set out in the working groups, especially WGIll, which is in the phase of making the first continental adjustment of vertical networks, as it is necessary to perform these international connections with the leveling and gravity networks of neighboring countries.

- Arica – Chacalluta (Perú)
- Arica – Tambo Quemado (Bolivia)
- Valparaíso – Paso Los Libertadores (Argentina)

Airborne Gravity Survey (Project)

OBJECTIVE

- Obtaining a modern and accurate geoid model for Chile to solve the problems of determining heights presented in our Country mainly by irregular topography and the large differences in height between the coast and the mountains.

- Phase 1: Arica to Concepción (2013)

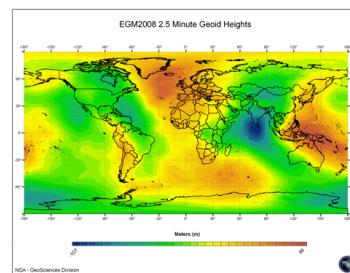

- Phase 2: The rest of the Country (?)

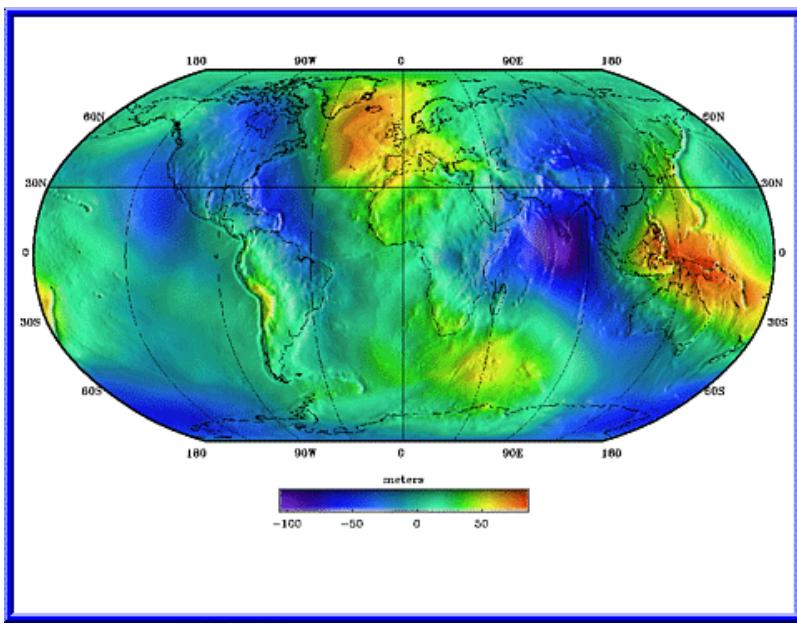

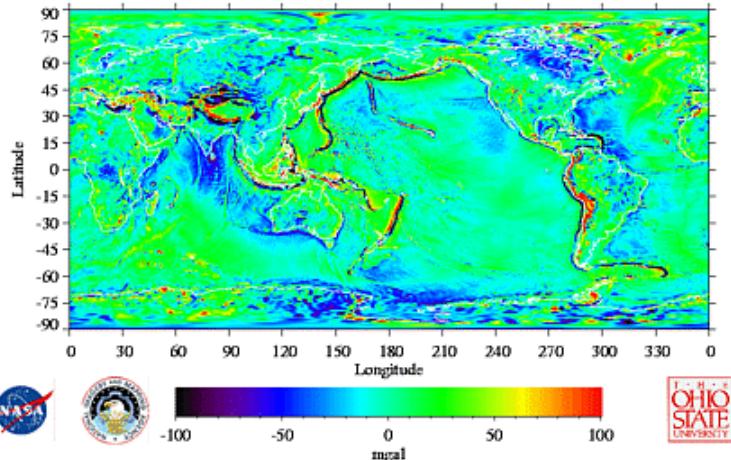

AGENCIES INVOLVED

- NGA (Steve Kenyon)
- National Space Institute (DTU-Space) (René Forsberg)
- IGM Chile

SIRGAS - CHILE PROCESSING AND ANALYSIS CENTER

The SIRGAS-Chile processing and analysis center currently has the responsibility of processing 112 SIRGAS-CON stations, maintaining the technical and human capacity to add more stations according to the requirements of SIRGAS.

País	Nº estaciones	Porcentaje
Chile	10	8.9%
Argentina	36	32.1%
Brasil	34	30.4%
Bolivia	5	4.5%
Perú	3	2.7%
Ecuador	17	15.2%
Uruguay	7	6.3%

In addition to the processing and analysis of the results, we check the monitoring station processing availability as well as the weekly RMS delivered by the SIRGAS center's combination.

SIRGAS - CHILE PROCESSING AND ANALYSIS CENTER

- In operation since 2012
 - Daily processing of 102 CGPS in Chile and South America.
 - Software: Bernese v5.2
 - GNSS data server at IGM for SIRGAS and national users. <ftp://200.27.184.147>
 - Weekly solutions to SIRGAS
 - Recovery and maintenance of National Reference Frame

The Maule Earthquake

Saturday
February 27, 2010
3:34 AM (local time)

Moment magnitude 8.8

This is the fifth largest event in the history of instrumental seismology. (The largest ever occurred in 1960, immediately to the south of this event).

Nearly 500 people were killed, the majority of them by the tsunami generated by the earthquake.

The tsunami warning was bungled, but years of training led much of the coastal population to see high ground which saved thousands.

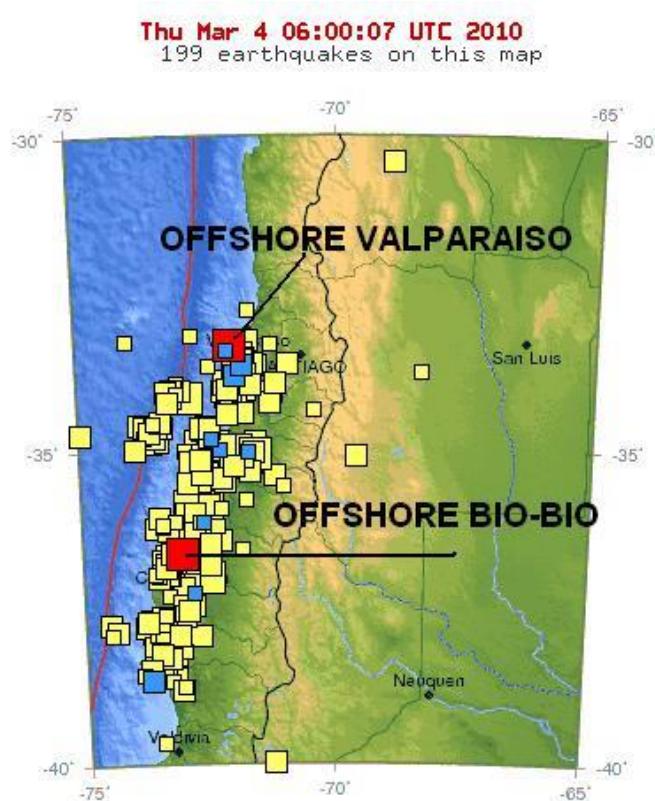

At least 250,000 homes were very badly damaged or destroyed. This is despite the fact that Chile has a strong seismic engineering code.

The EQ caused a blackout affecting 90% of Chile, in some areas for days.

Economic damage ~ US\$ 30 billion

The rupture zone of the main (M 8.8) event is indicated, at least roughly, by its aftershocks zone.

Aftershock Map - Mainshock and 458 Aftershocks

Last Updated: 29 March 2010, 18:19:54 UTC

Several aftershocks were close to magnitude 7-- decent sized earthquakes in their own right!

The 'Alto Rio' apt complex in Concepción, the most photographed example of building damage caused by the Maule event.

Some damage, such as that affecting this new building in Maipú (Santiago), occurred because the building codes were violated.

WHAT ABOUT THE SPATIAL REFERENCE SYSTEM?

Most surveyors and engineering firms in Chile use short baseline GPS surveys to do the bulk of their precise positioning.

A very large fraction of the reference points in use are survey markers, whose coordinates are provided by the Instituto Geográfico Militar (IGM), the ‘owner’ of the national spatial reference system.

They were very few CGPS stations in south-central Chile.

After the earthquake, all survey markers had been displaced, and were continuing to displace, and their positions are unknown.

Conclusion: the spatial reference system had also been damaged by the EQ, and it too was in need of reconstruction

The only viable solution was to build large numbers of CGPS stations in the affected region, very quickly. This effort was led by US geodesists of Project CAP working with IGM.

TRIPOD (ANTENNA MONUMENT)

Materials:

18 meters of 1 ¼" diameter steel rod
cut thus: 3 x 4m , 1 x 2 m , 4 x 1 m
(the 2 m rod must be drilled to accept coupler)
1 steel disk
1 stainless steel antenna coupler

Tools:

a 7,500 watt generator
an arc welding system
an angular grinder
a sliding hammer (*c.f. a fence post driver*)
a step ladder

CHILE, A COUNTRY OF EARTHQUAKES

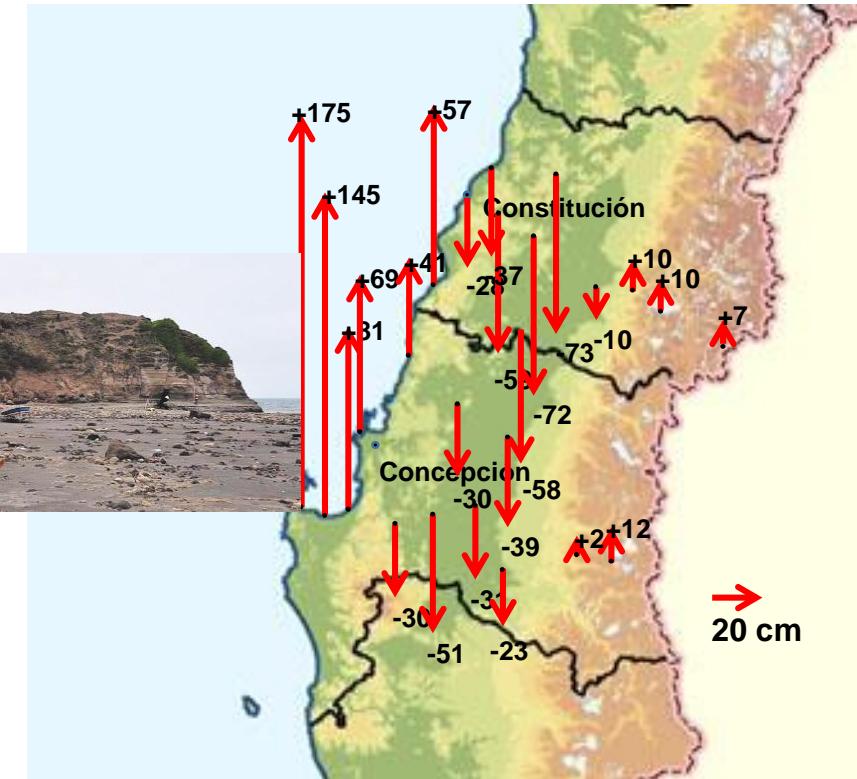

- On February 27, 2010, Chile suffered the ninth most violent earthquake in modern history (Mw 8.8), followed by several tsunamis that together destroyed and damaged private property and infrastructure of all kinds. The displacements found in plate tectonics (continental) in the south central area were from **centimeters to 5 meters**, which showed the large amount of energy released after this earthquake.
- On April 1, 2014 at 20:48 local time, the north of Chile suffered a Mw 8.2 earthquake, which shook the earth for 2 minutes from southern Peru to the Antofagasta region, causing a minor tsunami as happened in 2010.
- On September 16, 2015, the north central area of our country was hit by an earthquake Mw 8.4, again affecting the RGN.
